Hiring Team
LinkedIn - GTM Tech & Analytics
Sunnyvale / San Francisco

I'm applying for the AI Architect role on the GTM Tech & Analytics team. Building AI-powered internal features that help sales and customer success teams work better is exactly the kind of problem I want to work on - and the combination of evaluation rigor, responsible AI, and product-minded execution this role calls for maps directly to what I've built.

I built **Leasel** (github.com/venkatalakshmiparimala/Lease_complaince_rag) - three internal AI surfaces sharing one knowledge repository: document intelligence, an 8-agent LangGraph investigation pipeline, and a self-service interface. Responsible AI was built in from day one: HITL escalation on every regulated decision, audit logging on every agent action, access-controlled retrieval, and hard safety boundaries enforced in code - no AI auto-resolution of compliance or financial outcomes. That's the evaluation + guardrails + HITL combination this role lists as preferred qualifications, not bolt-on compliance.

On evaluation and observability: I built **AgentProbe** (github.com/venkatalakshmiparimala/AgentProbe) specifically because AI features need a measurement layer before and after they ship. Offline evals with golden datasets, LLM-as-judge scoring, tracing across agent runs, feedback loops, and a CI regression harness that catches degradations before they reach users. That's the evaluation and monitoring infrastructure LinkedIn is looking for in preferred quals.

Before these projects, I spent nine years at Entrata owning enterprise line-of-business modules end-to-end - backend services, APIs, data pipelines, and compliance workflows - for a regulated multi-tenant platform serving 100K+ users. Working across product, operations, and compliance to scope and deliver features is how I've worked for most of my career. The internal tooling context at LinkedIn's scale is the natural next step.

I'd welcome the conversation. Happy to walk through either project in depth or discuss how I'd approach building and measuring a new internal AI feature in the GTM context.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
