Kore.ai
Sales Engineer - United States

I build production agentic AI systems, and I help non-technical stakeholders understand and trust them. That combination is what the Sales Engineer role at Kore.ai needs - and it is what I have spent 5+ years developing.

At Entrata, I served as the embedded solutions architect for compliance, finance, and operations teams across 120+ Agile sprints. My job was to translate complex domain requirements - HUD income eligibility rules, AMI-based pricing logic, LIHTC compliance workflows - into production architectures that non-engineering stakeholders could rely on and audit. That is the same motion a Sales Engineer performs: listen, understand the customer's real problem, design the solution, and make it real. I did it internally for 5+ years across 20+ production modules for a 100K+ MAU platform. I have also delivered live technical workshops to 600+ students at George Mason University - translating abstract AI architectures into hands-on exercises for audiences with no prior programming background. Technical translation to non-technical audiences is a practiced skill, not an aspiration.

On the agentic AI side, my experience maps directly to Kore.ai's platform. I built **Leasel** - an 8-agent LangGraph cognitive architecture serving three enterprise surfaces (document intelligence, support investigation, and tenant self-service) with RAG retrieval, confidence scoring, HITL escalation, and a reproducible evaluation harness (93.6% precision). I also architected and delivered **Magizhs**, an agentic mission-planning system deployed across marketing, real estate, and commercial survey verticals - from problem definition through production, without a spec document. LangChain, LangGraph, RAG pipelines, multi-agent orchestration, and agentic process automation are my daily stack, not items on a skills list. When a Kore.ai enterprise customer asks "how does this agent decide when to escalate?" or "can you show me how the RAG layer retrieves from our document corpus?" - I can answer with production code, not slides.

I am excited about Kore.ai specifically because the Agent Platform is doing the right thing architecturally: separating the reasoning layer from the integration layer, and building evaluation into the product. That is the design philosophy I applied to LeaseI, and I would bring the same rigor to helping enterprise customers move from prototype to production on the Kore.ai stack.

I would welcome the opportunity to connect.
