Hiring Team, American Express -- AI Engineer, Agentic AI

Your job description says agentic AI systems at American Express must meet "high standards for reliability, security, and auditability" -- and that the team needs engineers who can build and operate evaluation and monitoring tooling alongside production agents. I built that tooling, independently, because I needed it to operate a production LangGraph system safely.

AgentProbe is an open-source evaluation and monitoring platform I built for production AI agents: a CI-integrated regression gate that blocks quality degradation before deployment, LLM-as-judge scoring with full agent tracing so every failure has a diagnosable root cause, and a multi-trial pass@k harness that measures whether changes actually improve agent behavior over time. I didn't build it as a portfolio project -- I built it because I was running LeaseI, an 8-agent LangGraph system handling regulated compliance decisions, and I needed to know whether it was safe to ship each iteration. Responsible AI in production means instrumenting the system before you trust it with real decisions. That's what AgentProbe does.

The same discipline applies in financial services. At Entrata, I owned a compliance-critical pipeline processing 180,000 housing eligibility records annually -- where a wrong output meant a wrong housing decision for thousands of residents. Zero compliance violations across seven years. Every release included baseline validation, reconciliation, and rollback preparation, because production reliability and auditability aren't optional in regulated domains. That mindset transfers directly to autonomous AI acting on real financial data.

What I'm looking for in this role: the opportunity to build production agentic systems where the bar is real -- where "reliable" and "auditable" are engineering requirements, not aspirations. American Express sets that bar in financial services. That's exactly the environment where the work I've built is most relevant.

Thank you for your consideration. I'd welcome the opportunity to discuss how my background in production agentic systems, evaluation infrastructure, and regulated-domain engineering aligns with what your team is building.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
