Camera & Photos Tools & AI Team
Apple Inc. — Cupertino, California

Full Stack Software Engineer — Camera & Photos Tools & AI Team

The best internal tooling disappears. Engineers stop noticing it because it just works — queries come back fast, regressions surface before they ship, the interface speaks their language. Building that kind of invisible infrastructure is what I do. It is what drew me to your team.

Last year I built **AgentProbe** — a full-stack AI evaluation framework I designed, implemented, and shipped entirely on my own. A **15-endpoint FastAPI backend**, a **React TypeScript observability dashboard**, a **5-metric LLM-as-judge evaluation engine** (factual accuracy, hallucination, retrieval quality, completeness, compliance), and CI/CD regression gates that block failing runs before they reach users. The engineers who use it do not think about the RAG layer or the async orchestration underneath. They get answers, they see drift, they ship with confidence. That is the experience I want to build for Apple's imaging engineers. You can see it live at github.com/venkatalakshmiparimala/AgentProbe.

I also bring direct camera imaging experience. At **Magizhs Tech**, I built image quality pipelines for aerial survey operations: computing **ground sampling distance**, **camera footprint geometry**, and overlap-driven line spacing to guarantee consistent image quality across survey grids. I encoded those parameters into a LangGraph agentic planning system that validated every mission against FAA constraints before export. I know what it means to express image quality requirements as engineering constraints — and to build systems that enforce them reliably.

At **Entrata**, I spent eight years building production software at scale — 20+ full-stack modules, 1M+ records, 100K+ monthly active users, 99.5% uptime across six consecutive months. I led distributed-systems redesigns, built asynchronous job execution pipelines that eliminated 80% of manual operational workload, and shipped the company's **first production AI pipeline on 1.6M real financial records** with quality gates, output validation, and bias-aware compliance checks. I have written code that other teams depended on daily for years. I understand what correctness and long-term operability actually cost when you get them wrong.

Your team is building LLM interfaces that let imaging engineers query massive datasets in natural language, evaluation pipelines that catch quality regression before it reaches a customer's camera roll, and async infrastructure that orchestrates analyses at Apple's scale. I have built each of these. I am ready to bring that to the Camera & Photos team and make the tools that help Apple's engineers do their best work.

Thank you for reading. I would welcome the chance to talk.
