Dear ClickHouse Hiring Team,

Your JD says it plainly: *"Design it, deploy it, measure whether it moves a real number."* That is the discipline I have built my career around.

I am a software engineer with 8+ years shipping production systems -- including CRM automation, Salesforce integrations, and Clay/n8n workflow engineering at Entrata -- now building agentic AI end-to-end. I built **AgentProbe** (github.com/venkatalakshmiparimala/AgentProbe): a Langfuse-equivalent LLM observability and evaluation platform. Three LangGraph agents, a 5-metric LLM-as-judge eval engine, and CI-integrated regression gating -- every commit auto-scored, failing runs blocked before they reach production.

Three specific reasons I fit this role:

1. The GTM tooling stack is already in production. Salesforce (custom objects, reporting automations, data sync, API connections), Clay, and n8n are all in my history at Entrata -- not side projects. I built CRM data pipelines connecting product data to commercial systems. The same motion applied to prospecting sequences, lead routing, and expansion signals is the natural next layer.

2. I ship agents I can measure. AgentProbe's eval engine scores agent runs on five metrics automatically. When I build a GTM agent for ClickHouse, I will also build the instrumentation that tells you whether it moved pipeline -- and by how much. Most engineers build the agent. I build the eval layer too.

3. ClickHouse's growth rate demands it. 250% YoY ARR growth means your GTM motion needs to compound without proportional headcount growth. Agents that qualify, route, and follow up autonomously -- with evals measuring every output -- are how you do that. That is the problem I want to work on.

M.S. Data Analytics Engineering, George Mason University, GPA 3.87, May 2026. F-1 STEM OPT -- three years of work authorization, H-1B eligible.
