Hiring Manager, Innovation Department
CSC Leasing Company
Richmond, Virginia

I'm applying for the Senior Software Engineer role on CSC's Innovation team. The job description is essentially a specification for the systems I've already built: agentic workflows with conditional routing, RAG retrieval with citation grounding, human-in-the-loop review gates, model evaluation with guardrails, and CI-integrated regression testing. I'd like to explain why those proof points are directly relevant.

AgentProbe is a production LLM evaluation framework I built from scratch: 5-metric eval engine (correctness, groundedness, hallucination rate, latency, token efficiency), LLM-as-judge scoring with a multi-trial pass@k harness, HITL escalation for low-confidence outputs, and a CI-integrated regression gate that blocks quality degradation on every commit. It also includes structured agent observability and tracing for failure analysis, and multi-provider LLM routing across Anthropic, OpenAI, Groq, and Ollama. This is the model evaluation practices, prompt engineering standards, and responsible AI governance framework your JD describes -- built and running. **Leasel** is the agentic platform it was built to evaluate: an 8-agent LangGraph pipeline with conditional routing, TF-IDF RAG retrieval over regulatory documents, validation guardrails enforcing compliance constraints, and HITL escalation on regulated decisions. 93.6% precision across 1,240 test cases. Together these demonstrate the agentic frameworks and AI operationalization discipline your Innovation team is building toward.

Before those projects, I spent nearly 7 years at Entrata owning production data pipelines that processed millions of compliance-critical records annually. I designed and maintained data models, managed data migrations, architected integrations between internal systems and external vendor platforms via middleware and API contracts, and eliminated 80% of manual operational workload through automation pipelines. I led an AWS cloud migration with 100% PHI compliance, optimized 200+ SQL queries, and shipped 20+ full-stack modules across 120+ Agile sprints. I also mentored 5+ engineers, conducted 300+ peer code reviews, and drove CI/CD and observability practices across the team. That's the production depth and technical leadership your senior IC role requires.

I work in AI-augmented development daily -- Claude Code with MCP integration is my primary development environment. I'm genuinely excited about what CSC is building: embedding agentic AI into a financial services platform at the infrastructure level, not as a bolt-on, is exactly the kind of problem I want to be working on. I'd welcome the chance to discuss how my background maps to your Innovation team's roadmap.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
