Deloitte - Frontier GenAI Practice
Re: Associate Forward Deployed Engineer, Frontier GenAI

The Forward Deployed Engineer role at Deloitte's Frontier GenAI practice sits exactly at the intersection of what I do: embed with clients, translate business requirements into production GenAI implementations, and ship agentic systems that hold up under real-world constraints. I have done this at two scales -- at a startup (Magizhs Tech, where I designed and deployed a LangGraph agentic platform for commercial survey and real estate stakeholders in a single internship cycle) and at enterprise scale (Entrata, where I shipped the company's first GenAI pipeline on 1.6M regulated financial records with quality gates and zero compliance incidents).

The proof that matters most for this role is **AgentProbe** -- a 3-agent LangGraph agentic platform I built from scratch: Orchestrator, RAG Tracer, and Auto Fix agents with inter-agent state handoffs, multi-provider LLM routing across Anthropic, OpenAI, Groq, and Ollama, and a 5-metric LLM-as-judge evaluation engine integrated into CI/CD. Failing runs block automatically before production. A React observability dashboard tracks regression drift and retrieval quality per run. This is not a demo -- it is a production-grade agentic platform, live on GitHub. And **Leasel** shows what I build when the stakes are high: an enterprise AI RAG compliance system achieving 93.6% precision on 1,240 lease PDFs with a deterministic rules engine ensuring every output is fully auditable. These two projects cover every technical preference listed in the Frontier GenAI JD.

What separates me from other engineers applying to Forward Deployed roles is the client-side translation layer. At Entrata, I spent 8 years not just writing code but sitting in cross-functional rooms with compliance teams, operations leads, and product stakeholders -- converting ambiguous business requirements into scalable enterprise systems across 120+ Agile sprints. I know how to ask the right questions before writing a single line, and how to deliver something a non-technical stakeholder can trust and use. That is the hardest part of forward deployment -- and it is the part I have done most.

I hold an M.S. in Data Analytics Engineering from George Mason University (GPA 3.87, May 2026) and bring 8+ years of production engineering across Python, AWS, data pipelines, and enterprise system integration. I am based in Virginia, authorized to work in the US, and ready to move fast.

I would welcome the chance to show you what I have built -- the GitHub links are in my CV and speak more directly than anything I could write here.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
