Hiring Team

**Infosys Financial Services**

Technology Consultant 1 -- AI/ML Engineering

Your Technology Consultant 1 description calls for engineers who can build and deploy LLM-based AI systems -- agents, fine-tuning workflows, prompt engineering, MLOps -- for financial services clients. I have built exactly that kind of stack from the ground up, in production, with compliance constraints built in at the architecture level.

My most recent system is **Leasel** -- an 8-agent LangGraph pipeline I designed end-to-end: RAG retrieval, structured data extraction, prompt engineering, and human-in-the-loop guardrails on regulated decisions. Evaluated across 1,240 test cases at **93.6% precision and 87.9% F1**. Every compliance-critical decision routes through a human gate -- the kind of architecture that matters when working with banks and financial institutions where incorrect outputs carry real liability. I also built **AgentProbe**, an open-source MLOps and LLM evaluation platform: CI-integrated regression gate, LLM-as-judge scoring, hallucination detection, and model monitoring across multiple LLM providers. This is the infrastructure that proves agents are working correctly before they touch production data.

On the model development side: I fine-tuned a **custom classification architecture using HuggingFace Transformers and PyTorch** at George Mason University -- built the training pipeline, deployed an inference API on Quart, and presented evaluation results to faculty. For the AWS AI services Infosys clients depend on, I have hands-on AWS infrastructure across the full SDLC (S3, EC2, RDS, Glue) and direct experience with Bedrock and SageMaker APIs for LLM routing and model deployment.

The financial services context specifically suits what I have built. At Entrata, I owned compliance-critical data systems for seven years -- 180,000 HUD records, housing eligibility calculations for 100K+ residents, and an AWS S3 migration with full PHI compliance and zero security incidents. That's the same discipline financial services clients need from an AI/ML consultant: systems that are accurate, auditable, and safe to run in regulated environments.

I am open to client-site engagement and the consulting delivery model. My experience spans the full SDLC -- from architecture and model selection through deployment, evaluation, and ongoing monitoring -- which is exactly what client-facing AI/ML delivery requires.

Sincerely,

**Venkata Lakshmi Parimala Pasupuleti**
