Dear Patreon Hiring Team,

Patreon's mission - fund the creative class - is one of the few in tech that produces something the world actually needs more of. I'm applying for the Staff Software Engineer, Backend Platform role because the work you're describing is the work I've spent eight years learning to do: building the foundational systems that product teams depend on to ship reliably, without thinking twice about what's underneath.

At Entrata, I owned the backend platform across 20+ production modules - RabbitMQ event-driven pipelines with retry logic and idempotency guarantees, Redis caching layers, Docker microservices redesign that delivered a 50% scalability improvement, and observability tooling that cut incident triage time by 40% across a multi-tenant environment serving 100K+ monthly active users at 99.5% uptime. I also built AgentProbe, an open-source backend platform for AI reliability: a 15-endpoint high-throughput FastAPI service with a CI-integrated regression gate, event-driven quality assessment engine, and full observability instrumentation - purpose-built so engineers can ship AI changes with the same confidence they'd ship anything else to production.

What draws me specifically to this team is the combination of foundational infrastructure work and the direct impact on creators: every improvement to reliability, API contract stability, or event throughput translates into creators being able to build and reach their audiences without friction. That's the kind of platform work that compounds. I mentor engineers through design reviews and code review, and I'd be glad to bring that same investment to growing a strong Backend Platform team at Patreon.

I'd welcome the chance to talk through how my background maps to what you're building.
