Re: Senior AI Platform Engineer

I spent 7 years at Entrata -- a PropTech SaaS platform serving 100K+ housing units -- owning the data infrastructure, compliance systems, and API architecture that property professionals depend on daily. I know the real estate domain from the inside: the regulatory complexity, the data quality requirements, the compliance obligations. When I read Realtor.com's mission -- breaking barriers to entry, making the biggest purchase of someone's life easier -- I recognize the operational weight behind it, not just the product vision.

AgentProbe is my answer to the observability problem this role is built around. It's an open-source LLMOps platform I built to solve exactly what your "robust gateway foundation" success metric describes: centralized LLM routing (multi-provider: Anthropic/Claude, OpenAI, Groq, Ollama), CI-integrated regression gate, LLM-as-judge scoring, hallucination detection, agent tracing (logs/metrics/traces), and Responsible AI guardrails (filters, rate limiting, PII controls, output validation). It is the operational infrastructure for knowing whether an AI system is ready before it reaches production. The MCP (Model Context Protocol) integration connects it to the broader agentic ecosystem.

For the agentic architecture work: LeaseI is an 8-agent LangGraph system with retrieval-augmented generation, memory layers, state management, and HITL access governance (regulated decisions always route to a human -- that boundary is enforced in code, not in policy). At Magizhs, I delivered a production agentic system for an enterprise client from architecture to deployment. I've built the SDKs, reference implementations, and orchestration patterns your JD describes -- not as experiments, but as shipped, evaluated, production systems.

On platform governance: at Entrata, I owned RBAC, least-privilege data access, HIPAA PHI controls, and AWS IAM policies across 7 years of production operation. Zero compliance violations. That same governance rigor is what this role applies to AI tool access -- provisioning, deprovisioning, identity lifecycle, policy-as-code, runbooks. I understand that discipline and I apply it to AI infrastructure.

I'd welcome the opportunity to discuss where AgentProbe's observability and governance approach maps to the paved-path platform you're building at Realtor.com.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
