Hiring Manager
School of Dentistry Information Technology
University of Maryland, Baltimore

Re: IT Application Integration Engineer — School of Dentistry

I am applying for the IT Application Integration Engineer role at UMSOD. The work this position describes -- determining how existing applications, legacy systems, databases, and web interfaces work together; leading the integration of new systems into an existing enterprise environment; and owning complex, cross-platform projects from requirements through go-live -- is precisely what I have done for nine years in production.

At Entrata, I was the long-term owner of multi-platform application integrations in a compliance-critical enterprise SaaS environment. I built and maintained integrations between internal CRM platform systems and external third-party vendor applications; defined data exchange standards and synchronization protocols; and owned the monitoring, alerting, and error-resolution workflows that kept those integrations running reliably across hundreds of thousands of active users. I led legacy system modernization projects -- including a database schema redesign that migrated hundreds of thousands of records to a modernized architecture -- and evaluated buy-vs-build decisions across the affordable housing module lifecycle. I gathered requirements directly from operations, compliance, and business leadership stakeholders, translated those requirements into technical designs, and delivered full implementations across 120+ Agile sprints. **Nine years of this work means I know where enterprise integrations break and how to build them so they don't.**

The lead projects for this role are a new radiology system and electronic patient record. I have not managed a radiology platform before -- I will say that plainly. What I bring is the integration architecture experience, the compliance discipline (HIPAA-compliant data platform design, encrypted ETL pipelines, RBAC-controlled data access), and the project ownership track record to lead those integrations successfully. I have built REST API integrations against FHIR-standard electronic health data systems, managed the full lifecycle of compliance-critical data migrations, and delivered complex cross-system projects under regulatory constraints. The domain is new to me; the work pattern is not.

I am currently completing my M.S. in Data Analytics Engineering at George Mason University (GPA 3.87, May 2026) while working as a Research Associate. Two years inside an academic institution -- managing data pipelines for faculty research, delivering analytics to university leadership, and navigating the stakeholder dynamics of an academic environment -- has given me direct experience with the context UMSOD operates in. I understand how IT work at a university is different from industry, and I find that difference genuinely appealing.

Thank you for your consideration. I would welcome the opportunity to discuss how my integration background applies to what UMSOD is building. My CV is enclosed.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
