Airbnb Ads Platform Team
Hiring Manager, Staff Software Engineer - Ads Platform
Airbnb, Inc.

Dear Airbnb Ads Platform Hiring Team,

The phrase **"AI-assisted → agentic → autonomous maturity curve"** in your Ads Platform posting is exactly how I think about building AI systems - and it is exactly what I built with LeaseI. When I read about your ambition to build a Growth Engine that advances along that autonomy curve, with the human-in-the-loop controls and brand safety gates that make autonomous campaigns safe to operate at scale, I recognized the engineering pattern immediately. The domain is different. The architecture is not.

LeaseI is the clearest proof point: an **8-agent LangGraph platform I architected and shipped solo**, designed around staged autonomy with deterministic HITL escalation. Routine queries resolve autonomously. Ambiguous cases escalate to human review before action is taken. The tenant self-service surface runs with deterministic guardrails that prevent out-of-bounds outputs. And the CI-integrated regression gate - built in AgentProbe - blocks any quality degradation before it ships. That is the same pattern an autonomous campaign system requires: high-confidence decisions execute autonomously, edge cases surface for human oversight, and nothing goes live without passing a quality gate. The result: **93.6% precision, 87.9% F1, zero unsafe outputs across 1,240+ test cases**. AgentProbe, the open-source evaluation platform I built alongside it, exists specifically to operationalize quality control for autonomous AI systems at any scale.

What excites me about the Ads Platform specifically is the alignment between the technical challenge and the business stakes. Autonomous campaign management is high-stakes engineering - a bidding error, a creative quality failure, or a brand safety miss has immediate, measurable consequences. That is the same environment I have operated in for **9+ years at Entrata**, where a compliance calculation error affects housing eligibility for real people at 100K+ housing units. Systems that operate autonomously in high-stakes environments demand the same discipline regardless of domain: correctness guarantees, auditability, staged rollout, and the ability to escalate with confidence when the system reaches its boundary. I bring that discipline, and I am genuinely excited to apply it to the scale and ambition of Airbnb's paid growth engine.

I would welcome the opportunity to discuss how the agentic systems architecture behind LeaseI and AgentProbe translates to autonomous campaign management - and how the quality-gate philosophy I have built into every production system I have shipped applies to brand safety and campaign correctness at Airbnb's scale.

Thank you for your time and consideration.
