Re: AI Enablement Engineer, IT — McLean, VA

COVER LETTER

Your JD asks for “production-quality automations — not prototypes.” That distinction is exactly how I build.

AgentProbe is my live proof: a 3-agent LangGraph runtime — Orchestrator, RAG Tracer, Auto Fix — with a **5-metric LLM-as-judge eval engine** (factual accuracy, hallucination, retrieval, completeness, compliance), CI/CD regression gates that block failing runs before they reach production on every commit, and a React observability dashboard tracking per-run metrics, latency, and retrieval drift in real time. The “production mindset” your JD calls out — error handling, logging, observability, testing or evaluations — is baked into the architecture, not bolted on afterward. It runs live at github.com/venkatalakshmiparimala/AgentProbe.

I applied the same standard to **Leasel**: a production RAG pipeline over 1,240 legal PDFs, hitting **93.6% precision and 87.9% F1** with a pass@k eval harness (pass@1 81.7%, pass@3 88.3%) and a regression gate that blocks deploys when quality drops. Chunking strategy, retrieval tuning, and a deterministic rules engine were each validated against a quantified eval before running on real data. I don’t ship AI I can’t measure.

On the infrastructure side: at Entrata I ran **AWS S3, RDS, and Glue at production scale** — 100% PHI compliance across all client data, zero security incidents. I defined technical standards for 20+ production modules across 1M+ records and 100K+ monthly active users. That AWS foundation extends directly to Bedrock: same security model, same IAM patterns, different API surface.

I’m based in McLean — the in-office requirement is a feature, not a compromise. And ID.me’s work sits exactly at the intersection where “good enough” fails: identity, trust, and government infrastructure demand the same auditable, measurable, production-grade approach I bring to every system I build. I’d welcome the conversation.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
