Hiring Team
Imbue
San Francisco, CA

I'm applying for the Software Engineer role at Imbue. I want to build open-source AI tools that actually serve people - and I have two projects that are direct evidence of that.

The first is **AgentProbe** (github.com/venkatalakshmiparimala/AgentProbe) - an open-source LLM evaluation toolkit I built because I needed to know whether my production AI systems were degrading quietly, before users noticed. It has a CI-integrated regression harness, LLM-as-judge scoring, a 5-metric eval engine, and multi-provider routing across Anthropic, OpenAI, Groq, and Ollama. I use it daily as a development tool. When I saw Vet in your product lineup, I recognized the same problem - catching AI mistakes before they reach people. I've already built something in that space, and I want to keep building it.

The second is **Leasel** (github.com/venkatalakshmiparimala/Lease_complaince_rag), an 8-agent LangGraph platform I built from a blank page. I chose the architecture, designed the schema, shipped three production surfaces sharing one knowledge repository, and operate it with a CI regression gate. 93.6% precision across 1,240 test cases. That's not a demo - it's a production system with a reliability story.

Before these projects, I spent nine years at Entrata shipping production backend systems at scale - APIs, distributed async processing, data pipelines, microservices, and compliance workflows for 100K+ users. I own what I build after it ships, and I know what it means to keep a system running in the real world.

Imbue's mission - AI that extends human will and judgment, tools people can actually modify and own - is the kind of work I want to spend my time on. I'm not looking for a job that uses AI; I want to be on the team that builds the tools that make AI genuinely useful to people. That's what you're doing, and it's where I want to be.

I'd love to talk. Happy to walk through either project in detail.

Sincerely,

Venkata Lakshmi Parimala Pasupuleti
